Influence of Financial Education on the Personal Budgeting of University Students in Ecuador

General Context of the Topic

Financial education has become a fundamental element in developing the competencies individuals need to manage their financial resources effectively and make informed financial decisions. For university students, this issue is particularly relevant because this stage of life is characterized by increasing financial independence and the need to make decisions regarding income, expenses, savings, and debt management. In this context, personal budgeting is an essential tool for planning financial resources, controlling expenditures, and promoting long-term financial stability.

Several studies agree that limited financial knowledge and skills may lead to poor money management, inadequate saving habits, and excessive indebtedness. Consequently, higher education institutions have increased their interest in incorporating financial education programs that strengthen students' financial competencies and encourage responsible financial behavior.

State of the Art

Recent scientific literature demonstrates a positive relationship between financial education and personal budgeting among university students. Ratnasari et al. (2025) argue that higher levels of financial literacy contribute to better personal financial management, reflected in improved budgeting practices, greater saving capacity, and lower levels of excessive debt. They also highlight that digital financial tools, such as mobile banking applications and electronic wallets, facilitate monitoring personal finances.

Similarly, Tan et al. (2024) indicate that budgeting behavior depends not only on financial knowledge but also on financial attitudes, subjective norms, perceived behavioral control, and behavioral intention. These findings suggest that financial education should be understood as a comprehensive process integrating knowledge, skills, and financial behavior.

Likewise, Teoh et al. (2026) propose a model in which budgeting practices function as a mechanism through which financial literacy and financial attitudes contribute to students' financial stability. From this perspective, personal budgeting is no longer viewed as an isolated activity but rather as a central component of responsible financial behavior.

Furthermore, Gerrans and Heaney (2019) report that university-level personal finance education significantly improves students' financial literacy, although behavioral changes require continuous educational interventions. In the Latin American context, Galarza Arellano (2023) demonstrates that financial education programs positively influence not

only financial knowledge but also behaviors related to saving, expenditure planning, and budgeting.

Overall, these studies reveal a consensus that financial education positively influences personal budgeting. Nevertheless, they also identify differences regarding the factors explaining this relationship. While some studies emphasize the importance of family financial socialization and personal attitudes, others incorporate variables such as digital technology, social norms, and financial stability.

Research Gap

Despite the increasing interest in this topic, important research gaps remain. First, most studies have been conducted in Asian countries or developed economies, whereas empirical evidence from Latin America—and particularly Ecuador—is still limited. Second, most existing studies employ cross-sectional and correlational research designs, restricting the possibility of establishing causal relationships between financial education and budgeting practices.

Moreover, personal budgeting is commonly examined as one dimension of overall financial management rather than as an independent construct composed of planning, expenditure monitoring, financial control, and budgeting discipline. Consequently, additional research is needed to better understand these relationships within different socioeconomic and cultural contexts.

Contribution of the Proposed Research

The proposed study will contribute to addressing these research gaps by examining the influence of financial education on the personal budgeting practices of university students in Ecuador. The research will provide empirical evidence within a context where limited studies currently exist and will contribute to understanding how financial knowledge, skills, and attitudes influence students' budgeting practices.

The findings may support universities in strengthening financial education programs by promoting educational strategies focused not only on increasing financial knowledge but also on developing practical skills related to budgeting, expenditure control, and responsible financial decision-making. Consequently, this research is expected to contribute both to the scientific literature and to the design of educational initiatives that improve the financial well-being of Ecuadorian university students.

Literature Review

The Influence of Financial Education on the Personal Budgets of College Students in Ecuador

General Context of the Topic

Financial education has established itself as a fundamental element in the development of skills that enable individuals to properly manage their financial resources and make responsible financial decisions. For college students, this topic takes on special relevance, as during this stage they begin to assume greater financial independence and face decisions related to managing income, expenses, savings, and debt. In this context, a personal budget is an essential tool for planning the use of resources, controlling expenses, and promoting adequate financial stability.

Various studies agree that limitations in financial knowledge and skills can lead to poor money management, difficulties in saving, and even debt problems. For this reason, institutions of higher education have shown increased interest in incorporating financial education programs that strengthen the skills necessary for the efficient management of personal finances.

State of the Art

Recent scientific literature demonstrates a positive relationship between financial education and personal budgeting among college students. Ratnasari et al. (2025) note that higher levels of financial literacy promote better personal financial management, reflected in a greater ability to create budgets, control expenses, save consistently, and avoid excessive debt. Furthermore, they highlight that the use of digital tools, such as mobile banking apps and e-wallets, makes it easier to track personal finances.

Similarly, Tan et al. (2024) argue that budgeting behavior depends not only on financial knowledge but also on factors such as attitudes toward money, social norms, perceived behavioral control, and the intention to act responsibly. These findings show that financial education should be understood as a process that integrates knowledge, skills, and behaviors.

For their part, Teoh et al. (2026) propose a model in which budgeting practices act as a mechanism through which financial literacy and financial attitudes contribute to improving students' economic stability. From this perspective, personal budgeting ceases to be an isolated activity and becomes an essential component of financial behavior.

Likewise, Gerrans and Heaney (2019) demonstrate that university-level education in personal finance significantly improves students' level of financial literacy, although they note that changing financial behaviors requires ongoing educational processes. In the Latin American context, Galarza Arellano (2023) demonstrates that financial education programs promote not only increased financial knowledge but also behaviors related to saving, spending planning, and budgeting.

Taken together, these studies reveal a consensus that financial education positively influences personal budget management. However, they also highlight differences regarding the factors that explain this relationship. While some studies emphasize the importance of family financial socialization and personal attitudes, others incorporate

variables such as digital technology, social norms, or financial stability as elements that strengthen financial behavior.

Identified Research Gap

Despite growing interest in this topic, the literature contains significant research gaps. First, most studies have been conducted in Asian countries or developed economies, with little empirical evidence regarding Latin American university students—and, in particular, Ecuadorian students. Second, cross-sectional and correlational studies predominate, which limits the ability to establish causal relationships between financial education and budgeting practices.

Furthermore, numerous studies analyze personal budgeting as a dimension of general financial management, without examining it specifically through components such as planning, expense tracking, financial control, and budgetary discipline. This situation highlights the need to expand research into contexts and methodological approaches that allow for a deeper understanding of university students' financial behavior.

How the Proposed Research Fills This Gap

This research will help bridge these gaps by analyzing the influence of financial education on the personal budgeting of university students in Ecuador. The study will provide empirical evidence in a context where there is still little research on this relationship and will help us understand how financial knowledge, skills, and attitudes are reflected in students' budgeting practices.

The results may serve as a basis for strengthening financial education programs in higher education institutions, promoting educational strategies aimed not only at increasing financial knowledge but also at developing habits of planning, spending control, and responsible decision-making. In this way, the research will contribute both to scientific knowledge and to the design of educational initiatives that promote the financial well-being of Ecuadorian college students.

Revisión de literatura

Influencia de la educación financiera en el presupuesto personal de estudiantes universitarios de Ecuador

Contexto general del tema

La educación financiera se ha convertido en un componente fundamental para desarrollar los conocimientos, habilidades y actitudes que permiten a las personas administrar eficazmente sus recursos económicos y tomar decisiones financieras informadas. En el caso de los estudiantes universitarios, este tema adquiere especial importancia porque durante esta etapa comienzan a alcanzar una mayor autonomía financiera y deben tomar decisiones relacionadas con el manejo de sus ingresos, gastos, ahorro y endeudamiento. En este contexto, el presupuesto personal constituye una herramienta esencial para

planificar el uso de los recursos, controlar los gastos y favorecer una estabilidad financiera sostenible.

Diversas investigaciones coinciden en que las limitaciones en los conocimientos y habilidades financieras pueden ocasionar una administración inadecuada del dinero, dificultades para ahorrar e incluso problemas de endeudamiento. Por esta razón, las instituciones de educación superior han incrementado el interés por incorporar programas de educación financiera que fortalezcan las competencias necesarias para una adecuada gestión de las finanzas personales.

Estado del arte

La literatura científica reciente evidencia una relación positiva entre la educación financiera y las prácticas de presupuesto personal en estudiantes universitarios. Ratnasari et al. (2025) señalan que mayores niveles de alfabetización financiera favorecen una mejor gestión de las finanzas personales, reflejada en una mayor capacidad para elaborar presupuestos, controlar los gastos, ahorrar de manera constante y evitar el endeudamiento excesivo. Además, destacan que el uso de herramientas digitales, como aplicaciones de banca móvil y billeteras electrónicas, facilita el seguimiento de las finanzas personales.

De manera similar, Tan et al. (2024) sostienen que el comportamiento presupuestario depende no solo del conocimiento financiero, sino también de factores como las actitudes hacia el dinero, las normas sociales, el control conductual percibido y la intención de actuar responsablemente. Estos resultados muestran que la educación financiera debe entenderse como un proceso integral que combina conocimientos, habilidades y comportamientos financieros.

Asimismo, Teoh et al. (2026) proponen un modelo en el que las prácticas presupuestarias funcionan como un mecanismo mediante el cual la alfabetización financiera y las actitudes financieras contribuyen a mejorar la estabilidad económica de los estudiantes. Desde esta perspectiva, el presupuesto personal deja de ser una actividad aislada y pasa a constituir un componente esencial del comportamiento financiero responsable.

De igual manera, Gerrans y Heaney (2019) demuestran que la formación universitaria en finanzas personales mejora significativamente el nivel de alfabetización financiera de los estudiantes, aunque señalan que la modificación de los comportamientos financieros requiere procesos educativos continuos. En el contexto latinoamericano, Galarza Arellano (2023) evidencia que los programas de educación financiera favorecen no solo el incremento del conocimiento financiero, sino también comportamientos relacionados con el ahorro, la planificación del gasto y la elaboración de presupuestos.

En conjunto, la literatura revisada muestra un consenso en que la educación financiera influye positivamente en las prácticas de presupuesto personal. Sin embargo, también identifica diferencias respecto a los factores que explican esta relación. Mientras algunos estudios resaltan la importancia de la socialización financiera familiar y las actitudes personales, otros incorporan variables como la tecnología digital, las normas sociales y la estabilidad financiera como elementos que fortalecen el comportamiento financiero.

Brecha de investigación

A pesar del creciente interés por esta temática, aún existen importantes vacíos de investigación. La mayoría de los estudios se ha desarrollado en países asiáticos o en economías desarrolladas, mientras que la evidencia empírica en América Latina y, particularmente, en Ecuador continúa siendo limitada. Asimismo, predominan investigaciones de carácter transversal y correlacional, lo que dificulta establecer relaciones de causalidad entre la educación financiera y las prácticas presupuestarias.

Además, el presupuesto personal suele analizarse como una dimensión de la gestión financiera general, sin estudiarlo como un constructo independiente integrado por la planificación, el seguimiento de los gastos, el control financiero y la disciplina presupuestaria. Esta situación evidencia la necesidad de ampliar las investigaciones hacia otros contextos y enfoques metodológicos que permitan comprender con mayor profundidad el comportamiento financiero de los estudiantes universitarios.

Cómo la investigación propuesta contribuye a reducir esta brecha

La presente investigación contribuirá a disminuir estos vacíos mediante el análisis de la influencia de la educación financiera en el presupuesto personal de estudiantes universitarios de Ecuador. El estudio aportará evidencia empírica en un contexto donde todavía existen pocas investigaciones sobre esta relación y permitirá comprender cómo los conocimientos, habilidades y actitudes financieras se reflejan en las prácticas presupuestarias de los estudiantes.

Los hallazgos podrán servir como base para fortalecer los programas de educación financiera en las instituciones de educación superior, promoviendo estrategias formativas orientadas no solo a incrementar el conocimiento financiero, sino también a desarrollar hábitos de planificación, control del gasto y toma responsable de decisiones. De esta manera, la investigación contribuirá tanto al avance del conocimiento científico como al diseño de iniciativas educativas dirigidas a mejorar el bienestar financiero de los estudiantes universitarios ecuatorianos.

5. Comparación entre el documento original y el back-translation

Después de realizar la retrotraducción, se verificó que el significado del documento original se mantuvo. Las principales diferencias identificadas fueron:

- Se sustituyeron algunas expresiones literales por términos más propios del inglés académico, como financial literacy, personal budgeting, financial autonomy y long-term financial stability.
- Se mejoró la estructura de varias oraciones para lograr una mayor fluidez y coherencia en inglés, sin modificar el contenido.
- Algunos conceptos fueron expresados con mayor precisión técnica durante la traducción y se conservaron en la retrotraducción.

- No se identificaron cambios en las ideas principales, los argumentos ni en la interpretación de la literatura revisada.

Esta comparación confirma que la traducción al inglés preservó fielmente el contenido y el propósito académico del documento original.

Proceso de traducción

Herramientas utilizadas para la traducción:

- ChatGPT: traducción inicial de la revisión de literatura del español al inglés académico.
- DeepL: verificación y ajuste de la traducción, especialmente de la terminología técnica.
- Grammarly: revisión de gramática, ortografía, puntuación y estilo académico en inglés.
- ChatGPT (Back-translation): retrotraducción al español para verificar que el significado del documento original se mantuviera.

Términos técnicos que verifiqué específicamente:

- Educación financiera (*Financial education*)
- Alfabetización financiera (*Financial literacy*)
- Presupuesto personal (*Personal budgeting*)
- Comportamiento presupuestario (*Budgeting behavior*)
- Estabilidad financiera (*Financial stability*)

Las diferencias identificadas entre mi documento original y la versión corregida fueron las siguientes:

- Se ajustaron algunas expresiones para que fueran más naturales en inglés académico, evitando traducciones literales.
- Se estandarizó la terminología técnica de acuerdo con la utilizada en la literatura científica internacional.
- Se mejoró la estructura y cohesión de varias oraciones para lograr una mayor claridad y fluidez en la redacción.
- Se realizaron correcciones menores de gramática, puntuación y estilo mediante Grammarly.
- La retrotraducción confirmó que el significado, las ideas principales y las conclusiones del documento original se mantuvieron sin cambios sustanciales.
